SUMMARY

Backend engineer with 10 months of production experience on a large multi-service platform, working across **C# / .NET Core**, **Python** and **Java**. Builds REST APIs and event-driven microservices on **Apache Kafka**, backed by **SQL Server**, **Redis** and **OpenSearch**, deployed on **Kubernetes**. Hands-on with **Apache Flink** stream processing, Python webhook-dispatch and scheduled services, query performance tuning, and production troubleshooting with root-cause analysis on live systems.

PROFESSIONAL EXPERIENCE

Junior Software Engineer — Backend
May 2026 – Nov 2026
Locobuzz · Mumbai, India

- Developed and maintained backend services and REST APIs in **C#, .NET Core and ASP.NET Core** — Web API controllers, dependency injection, configuration and background worker services.
- Built **Kafka** producers and consumers for event-driven microservices (consumer groups, offset handling, serialization, retries, dead-letter paths); validated a pipeline sustaining **~300 messages/second** under load testing.
- Cut a repeatedly executed configuration lookup from **~21,000 queries/day to ~150/day** by introducing a two-tier **Redis** cache with an invalidation contract, removing the stale-read risk.
- Traced and eliminated a runaway query pattern responsible for roughly **1.4 million redundant database calls**, removing a recurring source of connection-pool exhaustion.
- Worked on **Apache Flink** streaming pipelines (**Java**) — diagnosed consumer-lag bursts and TaskManager failures, and tuned job parallelism and autoscaling to restore throughput.
- Built and maintained **Python** services: a webhook API dispatcher, scheduled cron jobs, and a dynamic query-builder module for a web and news data indexing service.
- Wrote and debugged **SQL Server** stored procedures and queries over large production tables; analysed execution plans and indexes to resolve slow and timing-out queries.
- Configured **OpenSearch / Elasticsearch** indexes, mappings and analyzers to improve search relevance and response time.
- Supported **Kubernetes** deployments and production monitoring; owned live incidents end to end — reproduce, trace across service boundaries, fix root cause, verify in production.
- Integrated third-party **REST APIs and webhooks**, handling JSON payloads, OAuth token refresh lifecycles, rate limits and upstream failures; managed branching and releases in **Git**.

Backend Developer Intern
Jan 2026 – Apr 2026
Locobuzz · Mumbai, India

- Learned the .NET Core microservice codebase and delivered scoped bug fixes and small features in live services.
- Picked up Kafka fundamentals hands-on — topics, partitions, consumer groups and lag — by tracing real messages through the data pipeline; queried production-scale SQL Server data to verify every fix changed the stored result.

TECHNICAL SKILLS

Languages	C#, Python, SQL (T-SQL), Java, JavaScript
Backend	.NET Core / .NET 8–9, ASP.NET Core, Web API, Entity Framework Core, REST, microservices
Streaming & Messaging	Apache Kafka, Apache Flink, event-driven architecture, webhook APIs
Data & Caching	SQL Server (stored procedures, indexing, query optimisation), Redis, OpenSearch / Elasticsearch, MySQL, MongoDB
DevOps & Tools	Kubernetes, Docker, Git / GitHub, CI/CD pipelines, SSMS, DBeaver, Postman, Visual Studio
Core Concepts	OOP, SOLID, design patterns, data structures & algorithms, concurrency & async programming, multithreading, distributed systems, system design fundamentals
Practices	Production support, root-cause analysis, performance optimisation, unit testing, code review

PROJECTS

Order Events — Event-Driven Backend — C#, .NET 9, ASP.NET Core, Kafka, Redis, SQL Server, EF Core, Docker · github.com/harshadchaudhary/order-events-api
REST API that persists an order and publishes to Kafka, plus a worker that consumes the event, applies the rules and writes back the outcome. Manual offset commits after successful handling, idempotent writes against at-least-once redelivery, Redis cache-aside with invalidation, 22 xUnit tests, full Docker Compose stack.

UrbanGraph — Real-Time Traffic Intelligence Platform — Python
End-to-end platform ingesting live traffic data, modelling it as a graph and surfacing route and congestion insight.

Prediction Services — Python, Scikit-learn, Flask, Streamlit
Car Price Predictor and Student Marks Predictor — model comparison and feature analysis served through Flask APIs with interactive dashboards.

EDUCATION & CERTIFICATIONS

B.Sc. (Information Technology) — Lord's Universal College, University of Mumbai — 2025 · 6.9 CGPA

Full Stack Web Development – Edufyi Tech Solutions (2025) · Google Generative AI Certificate (2025) · Career Essentials in Software Development – Microsoft & LinkedIn (2024)
