SUMMARY

Junior .NET Backend Developer with 10 months of production experience developing and maintaining backend services, REST APIs and microservices using C#, .NET Core and ASP.NET Core. Works extensively with SQL Server (SSMS, DBeaver) on stored procedures, debugging and query performance optimisation. Hands-on with Apache Kafka for event-driven architecture, Redis for caching and performance improvement, and OpenSearch / Elasticsearch for search optimisation, indexing and analyzer management. Supports Kubernetes-based deployments, production monitoring and troubleshooting, and manages code versioning, branching and releases with Git.

PROFESSIONAL EXPERIENCE

Junior .NET Backend Developer — May 2026 – Present
Locobuzz · Mumbai, India

- Develop and maintain backend services and REST APIs in **C#, .NET Core and ASP.NET Core**, covering Web API controllers, dependency injection, configuration and background worker services.
- Build **Kafka** producers and consumers for event-driven microservices — consumer groups, offset handling, serialization, retries and dead-letter paths — and monitor consumer lag to keep pipelines current.
- Write and debug **SQL Server** stored procedures and queries over large production tables; analyse execution plans and indexes to resolve slow and timing-out queries.
- Implement **Redis** caching layers for frequently read configuration and lookup data, including key design, expiry strategy and cache invalidation to prevent stale reads.
- Configure and tune **OpenSearch / Elasticsearch** indexes, mappings and analyzers to improve search relevance and response time.
- Support **Kubernetes**-based deployments and production monitoring; handle live incidents end to end — reproduce, trace across services, fix root cause, verify in production.
- Build and maintain third-party **API and webhook integrations**, handling JSON payloads, authentication and token refresh lifecycles, rate limits and upstream failures.
- Manage branching, code review and release workflows in **Git** across multiple service repositories; containerise services with **Docker**.

Backend Developer Intern (.NET) — Jan 2026 – Apr 2026
Locobuzz · Mumbai, India

- Learned the .NET Core service codebase and microservice architecture, then delivered scoped bug fixes and small features in live services.
- Picked up Kafka fundamentals hands-on — topics, partitions, consumer groups and lag — by tracing real messages through the data pipeline.
- Queried production-scale SQL Server data to investigate reported issues and verify that fixes changed the stored result.
- Adopted the team's Git branching workflow, code review process, Docker setup and deployment pipeline.

TECHNICAL SKILLS

Languages	C#, SQL (T-SQL), Python, Java, JavaScript
Frameworks	.NET Core / .NET 8–9, ASP.NET Core, Web API, Entity Framework
Messaging & Caching	Apache Kafka, Redis
Databases	SQL Server (stored procedures, indexing, query optimisation), MySQL, MongoDB
Search	OpenSearch, Elasticsearch — indexing, mappings, analyzers
DevOps & Tools	Kubernetes, Docker, Git / GitHub, SSMS, DBeaver, Postman, Visual Studio, VS Code
Concepts	REST API design, microservices, event-driven architecture, webhook APIs, JSON & Avro handling, production support, root-cause analysis, backend performance optimisation

PROJECTS

Order Events — Event-Driven Backend — C#, .NET 9, ASP.NET Core, Kafka, Redis, SQL Server, EF Core, Docker
REST API that persists an order and publishes to Kafka, plus a worker service that consumes the event, applies the rules and writes back the outcome. Manual offset commits after successful handling, idempotent writes against at-least-once redelivery, Redis cache-aside with invalidation, and 22 xUnit tests. Runs end to end via Docker Compose.

Library Management Website — .NET, React.js, JavaScript, MySQL
Full-stack application for managing books, members and borrowing records, with authentication and full CRUD across entities.

UrbanGraph — Real-Time Traffic Intelligence Platform — Python
End-to-end platform ingesting live traffic data, modelling it as a graph and surfacing route and congestion insight.

Car Price Predictor — Python, Scikit-learn, Flask
Compared Linear Regression, Random Forest and Decision Tree models (evaluated on R^2 and MAE), served through a Flask API with an HTML/CSS front end.

Student Marks Predictor — Python, Scikit-learn, Flask, Streamlit
Predicts student performance with feature-importance analysis and PCA; Flask prediction API plus an interactive Streamlit dashboard.

EDUCATION

B.Sc. (Information Technology) — Lord's Universal College, University of Mumbai **2025 · 6.9 CGPA**

CERTIFICATIONS

- Full Stack Web Development — Edufyi Tech Solutions (Apr 2025)
- Google Generative AI Certificate (Oct 2025)
- Career Essentials in Software Development — Microsoft & LinkedIn (Dec 2024)
- Career Essentials in Project Management — Microsoft & LinkedIn (Nov 2024)
