SUMMARY

Backend engineer with 10 months of production experience on a large multi-service platform, working across **C# / .NET Core**, **Python** and **Java**. Builds REST APIs and event-driven microservices on **Apache Kafka**, backed by **SQL Server**, **Redis** and **OpenSearch**, deployed on **Kubernetes**. Hands-on with **Apache Flink** stream processing, query tuning and production root-cause analysis.

PROFESSIONAL EXPERIENCE

Junior Software Engineer — Backend
May 2026 – Nov 2026

Locobuzz · Mumbai, India

- Developed and maintained backend services and REST APIs in **C#, .NET Core and ASP.NET Core** — Web API controllers, dependency injection and background worker services.
- Built **Kafka** producers and consumers for event-driven microservices (consumer groups, offset handling, serialization, retries, dead-letter paths); validated a pipeline sustaining **~300 messages/second** under load testing.
- Cut a repeatedly executed configuration lookup from **~21,000 queries/day to ~150/day** by introducing a two-tier **Redis** cache with an invalidation contract, removing the stale-read risk.
- Traced and eliminated a runaway query pattern responsible for roughly **1.4 million redundant database calls**, removing a recurring source of connection-pool exhaustion.
- Worked on **Apache Flink** streaming pipelines (**Java**) on **AWS Managed Service for Apache Flink** — diagnosed consumer-lag bursts and TaskManager failures, and tuned parallelism per KPU and autoscaling to restore throughput.
- Built and maintained **Python** services: a webhook API dispatcher, scheduled cron jobs, and a dynamic query-builder module for a web and news data indexing service.
- Wrote and debugged **SQL Server** stored procedures over large production tables, analysing execution plans and indexes to resolve slow and timing-out queries; configured **OpenSearch / Elasticsearch** mappings and analyzers to improve search relevance.
- Integrated third-party **REST APIs and webhooks** (JSON payloads, OAuth token-refresh lifecycles, rate limits); supported **Kubernetes** deployments and monitoring, and owned live incidents end to end — reproduce, trace across service boundaries, fix root cause, verify in production.

Backend Developer Intern
Jan 2026 – Apr 2026

Locobuzz · Mumbai, India

- Delivered scoped bug fixes and small features in live **.NET Core** microservices; learned **Kafka** fundamentals hands-on by tracing real messages through the data pipeline, and queried production-scale **SQL Server** data to verify every fix changed the stored result.

TECHNICAL SKILLS

Languages: C#, Python, SQL (T-SQL), Java, JavaScript

Backend: .NET Core / .NET 8–9, ASP.NET Core, Web API, Entity Framework Core, REST, microservices

Streaming & Messaging: Apache Kafka, Apache Flink, event-driven architecture, webhook APIs

Data & Caching: SQL Server (stored procedures, indexing, query optimisation), Redis, OpenSearch / Elasticsearch, MySQL, MongoDB

Cloud & DevOps: AWS (Managed Service for Apache Flink), Kubernetes, Docker, Git / GitHub, CI/CD pipelines, SSMS, DBeaver, Postman, Visual Studio

Core Concepts: OOP, SOLID, design patterns, data structures & algorithms, concurrency & async programming, multithreading, distributed systems, system design fundamentals

Practices: Production support, root-cause analysis, performance optimisation, unit testing, code review, Agile/Scrum

PROJECTS

Order Events — Event-Driven Backend — C#, .NET 9, ASP.NET Core, Kafka, Redis, SQL Server, EF Core, Docker · github.com/harshadchaudhary/order-events-api
REST API persists an order and publishes to Kafka; a worker consumes it, applies the rules and writes back the outcome. Manual offset commits after success, idempotent writes against at-least-once redelivery, Redis cache-aside, 22 xUnit tests, Docker Compose.

Feed Ingest Service — Python, FastAPI, APScheduler, SQLAlchemy, PostgreSQL, Redis, pytest, Docker · github.com/harshadchaudhary/feed-ingest-service
Idempotent upserts keyed on a SHA-256 content hash, a Redis lock preventing overlapping runs, high-water-mark incremental fetching, HMAC-verified webhook intake, jittered retry with timeouts. 95 pytest tests; pure, I/O-free parsing module.

EDUCATION & CERTIFICATIONS

B.Sc. (Information Technology) — Lord's Universal College, University of Mumbai **2025 · 6.9 CGPA**

Certifications: Full Stack Web Development, Edufyi Tech Solutions (2025) · Google Generative AI (2025) · Career Essentials in Software Development, Microsoft & LinkedIn (2024)
